Looking for a system that connects a patient to the central who has access to patient data. For example, a patient can distribute passwords only to people the patient desires to have access to the patient data (see underlined portion of claim 1). The key distinction over the prior art is that the central server does not do any identity verification. As long as a valid password or PIN is entered, the user is allowed access to the data. Thus the ~~password~~ passwords or PINs are distributed by the patient to other users without the central server verifying who the users are.

STAFF USE ONLY
